

ABSTRACT

PURPOSE: To control the medical data of the same examinee by relating the data with each other and to easily refer to the medical data of a specified examinee when the examinee is diagnosed, in a medical data control system delivering medical data to a center after the medical data is collected from the examinee in a medical institution and controlling the medical data in the center.

CONSTITUTION: A center is provided with a receiver 21 receiving the medical data delivered from a medical institution and a storage means 22 storing the name, the gender and the date of birth of an examinee as examinee data with the medical data. Because the medical data delivered from many medical institutions is controlled with the name, the gender and the date of birth of the examinee in the center, even the medical data delivered separately from many medical institutions can be controlled as the medical data of the same examinee.

ABSTRACT

PURPOSE: To enable only software of predetermined specifications to access data stored in an information storage medium by allowing the software to access the information storage medium only when it is recognized that the right to access is requested by following a predetermined procedure.

CONSTITUTION: Software programs A and B on an access device 1 access an information storage device 2. The software B requests the right to access not by following the predetermined procedure, so the information storage device 2 recognizes that, disables the access to the information storage medium 3 by the software B, and sends an error back. The software A requests the right to access by following the predetermined procedure, so the information storage device 2 recognizes that the right to access is requested by following the predetermined procedure, judges that the software A knows the access method, and permits the software A to access the information storage medium 3 for data reading and writing, etc.
